

Docker Swarm

Docker Swarm is a cluster management and orchestration tool provided by Docker.

Orchestrators

Orchestrators provide a number of different types of functionality which assist in keeping a containerized application live and available to its users.

- Autoscaling: Automatically adds or remove containers to deal with heavier demand or low demand
- Garbage Collection: Guarantee high availability by ensuring enough containers are running to provide the service.

Orchestrators can enhance how you might use containers for serving your software or providing your application as a service.
